Water is a life-essential resource yet, at less than a penny a gallon, it costs very little compared to its value.

Your water rates pay for everything it takes to operate our water system, from storage and treatment, to delivering the water to your tap. Your water rates also help pay for water system improvements that ensure that we will provide high-quality drinking water for generations to come.

As this year’s Drinking Water Quality Report shows, this is an exceptional value for the clean, safe, great-tasting drinking water you receive.
Your drinking water comes from Spada Lake Reservoir, located about 30 miles east of Everett at the headwaters of the Sultan River. This 50-billion-gallon storage facility serves as a collection point for rain and snowmelt from the Cascade Mountains. It was created in 1964 through a partnership between the City of Everett and the Snohomish County PUD as part of the Jackson Hydroelectric Project.

Spada Lake Reservoir is located in the Upper Sultan River Watershed, an area encompassing more than 80 square miles. This is one of the wettest watersheds in the continental United States. The average annual rainfall is about 165 inches—five times the rainfall in Everett.

Water quality in the Sultan Basin is carefully monitored. To protect the naturally pristine water in Spada Lake Reservoir, the watershed is patrolled and human activities are limited to minimize the impact on water quality. We continue to evaluate and adjust our security measures on an ongoing basis.

Precipitation and snowmelt from the Cascade Mountains are collected in Spada Lake Reservoir.

From Spada, water travels to Chaplain Reservoir, where the City’s water treatment plant is located.

The Everett Drinking Water Treatment Plant treats the water using coagulation, flocculation, filtration and disinfection.

Water transmission pipelines carry drinking water to Everett.

Treated water is delivered to about 603,000 people or 80 percent of the businesses and households in Snohomish County.
## Detected regulated contaminants

</table>

These substances are disinfection by-products for which no MCL standard has been set, but which must be monitored to determine compliance with the EPA MCLs for Total Trihalomethanes and Haloacetic Acids (5).

### Important Terms:
- **Turbidity**: Turbidity is a measure of particulates suspended in water in Nephelometric Turbidity Units (NTU) and is an important test in determining drinking water quality. Particulates in water can include bacteria, viruses and protozoans that can cause disease.
- **Maximum Contaminant Level Goal (MCLG)**: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
- **Maximum Contaminant Level (MCL)**: The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available water treatment technology.
- **Maximum Residual Disinfectant Level (MRDL)**: The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
- **Maximum Residual Disinfectant Level Goal (MRDLG)**: The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

### Required Monitoring Violation Statement:
We are required to monitor your drinking water for specific contaminants on a regular basis. Results of regular monitoring are an indicator of whether or not your drinking water meets health standards. During March, April and May 2017, an equipment malfunction caused erroneous turbidity data to be recorded and reported to the Dept. of Health. Although the problem was resolved and correct data was provided to the Dept. of Health, this constitutes a monitoring violation that requires public notification (see below).

**Everett is required to operate corrosion control treatment at or above a minimum daily average pH of 7.4. The average daily pH cannot be below 7.4 for more than nine days every six months. In 2017, the average daily pH dropped below 7.4 for eight days.**

### Required Lead Statement:
If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Everett Utilities Division is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to two minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead/.
All water sources (both tap water and bottled water) contain impurities. As water flows over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

- **Microbial contaminants** such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife.
- **Inorganic contaminants**, such as salts and metals, which can be naturally occurring or result from urban surface water, industrial or domestic wastewater discharges, oil and gas production, mining or farming.
- **Pesticides and herbicides**, which may come from a variety of sources such as agriculture, urban surface water and residential uses.
- **Organic chemical contaminants**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and may also come from gas stations, urban stormwater runoff and septic systems.
- **Radioactive contaminants**, which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, US Environmental Protection Agency (EPA) prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA Safe Drinking Water Hotline at 1-800-426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised people, such as people with cancer undergoing chemotherapy, people who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA and US Center for Disease Control (CDC) guidelines on appropriate means to lessen risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline at 1-800-426-4791.

Everett’s source water contains virtually no lead and Everett has eliminated lead pipes and connections from its distribution system. However, lead can enter drinking water through household plumbing materials.

In 1991, the EPA published a regulation to control lead and copper in drinking water. This regulation, known as the Lead and Copper Rule, requires water systems to monitor the presence of lead in drinking water at customer taps. If lead concentrations exceed an action level of 15 parts per billion in more than 10% of customer taps sampled, the system must undertake a number of actions.

Everett conducted its latest round of monitoring in 2015. The highest level found in the 108 homes tested was 8 parts per billion. The highest result obtained in 90 percent of the households sampled was 2 parts per billion. This indicates that lead found at household taps is most likely due to the corrosion of home plumbing systems with lead-containing pipes, fixtures or solder.

There are simple steps you can take to reduce the risk of lead in your drinking water. If you live in housing built before the mid-1940s, run your tap for at least 2 minutes after water has sat in your pipes for more than 6 hours. If you live in newer housing, run your tap until the water is noticeably cooler. Use only cold water for drinking, cooking and making baby formula, as hot water carries more lead. You can also have your water tested by a certified lab.

For more information on lead in drinking water, steps you can take to minimize exposure, or to find a certified lab, go to www.doh.wa.gov/leadindrinkingwater.
Ensuring an adequate supply

Water is a precious resource. Conservation helps meet the needs of people, industries, businesses and farms, while also keeping fish and aquatic life alive and well. Because Everett provides water to the majority of water systems in Snohomish County, we operate a regional water conservation program. This program is developed collaboratively with the water systems we serve and funded from water system revenues.

More than $7 million has been invested in regional water conservation activities since 2001. This includes school education, indoor and outdoor water conservation kits, rebates for water efficient clothes washers and toilets, leak detection, business water audits and school irrigation audits. Through these efforts, we have saved more than 4.5 million gallons per day (MGD)—enough water to fill more than 100,000 bathtubs each day.

The regional conservation program is planned and implemented as part of Everett’s comprehensive water plan. The first plan covered the period from 2001 through 2006; the second from 2007 through 2012. Everett’s latest comprehensive water plan covers the period through 2019 and focuses on school education, residential conservation and activities to assist large water users.

In 2017, more than 19,000 students attended water conservation workshops in classrooms throughout Snohomish County, water systems distributed more than 2,400 indoor conservation kits and 2,900 outdoor conservation kits, and 15 large water customers received water conservation audits. These activities saved an estimated 0.67 million gallons per day (MGD) regionally.
Conservation tips

- Install water-efficient showerheads and take shorter showers.
- Fix leaky faucets and toilets. Install low-flow toilets.
- Only run full loads in your dishwasher and clothes washer.
- Put a layer of mulch around plants and trees.
- Use a broom—not a hose—for cleaning walks and driveways.

For additional tips and information about our water conservation programs, go to www.everettwa.gov/conservation.
