**City of Everett Infiltration Infeasibility Map**

This map identifies areas that are considered infeasible for infiltration based on the analysis provided in *Everett Stormwater Infiltration Infeasibility Assessment*, prepared for the City of Everett by Kindred Hydro, Inc., June 2017. As discussed in the report, the following features are considered infeasible for infiltration:

- Slopes steeper than 25 percent.
- The former Everett Landfill and a buffer area of 100 feet around the landfill.
- The special soils handling area associated with the Everett Smelter Site and a buffer area of 100 feet around the area.

Because the accuracy of these features depends on the accuracy of the data used to create them, inaccuracies may exist, as described in the above referenced report.
